QMI Introduces Tamper Devices

QMI products have been used in a wide range of industries since 1983. These industries include dairy processing, dairy farm, pharmaceutical, biotechnology, beverage, brewing and other industries that have a need to sample liquid processes. Our products have proven to be valuable tools for many QA/QC programs such as Hazard Analysis Critical Control Point (HACCP) systems.

Recently several of our customers have expressed interest in using QMI products in isolated areas such as on over-the-road tankers, isolated piping systems and other less frequently monitored areas. Under these conditions, unwanted injections or product removal could be a concern.

To reduce the risk of tampering or unwanted removal of product, QMI has developed two devices: the QMI Tamper-Evident Device is a white cap that fits over the nut. The blue QMI Security Seal is numbered for easy record keeping within a laboratory facility. The cap cannot be removed unless the Security Seal is cut.

The QMI Tamper-Resistant Device is a stainless cap that locks the nut into place covering the Aseptic Sampler completely. Samples cannot be taken, nor can injections be made, unless the device is unlocked and removed.

If you are interested in learning more about these products, please visit our website or contact QMI for more information.

New Website!

QMI launched a new website in April. Our updated site includes past newsletters, updated SOP’s, a complete parts list, an FAQ section, news and announcements and many other resources to help our customers become more familiar with our products.
