

Amp up your skincare routine!

CBI's selection of Professional Ampoules contains a broad range of advanced concentrates designed to combat and control specific skin conditions and create immediate corrective effects when incorporated into your menu of services

VITAL C AMPOULE

Highly concentrated, stabilized Vitamin C improves tone & Texture, exfoliates, brightens, and helps speed up collagen production.

DNA AMPOULE

Water-soluble DNA forms a thin protein film acting as a "second skin" to guard against environmental stressors, while hydrolyzed RNA increases moisture levels, strengthens and restores.

VITAL K AMPOULE

Vitamin K helps improve the look of capillaries on this skin while Vitamins A and E balance, increase elasticity, moisture, and protect skin from further damage.

HYALURONIC ACID

Naturally occurring in the dermal layers; binds over 10,000 times its weight in water, providing lubricity, while boosting and maintaining hydration levels.

SWISS COLLAGEN AMPOULE

Soluble collagen blended with vitamins, amino acids, and minerals, forms reticulated emollient layer on the skin that soothes, softens and promotes cellular regeneration

Amp Up Your Skincare!

CBI offers several different varieties of ampoules to accommodate various skin conditions, dehydrated, aging, hyperpigmentation, as well as, irritated, damaged skin. Visible results are achieved within a short time after application.

- DNA – For new scars, acne, dilated pores, post-treatment
- Hyaluronic Acid – For dehydrated skin, absorbs up to 1000 times its weight in water
- Swiss Collagen – Known to stimulate formation of collagen, soothes and hydrates, great for post-microdermabrasion
- Vital C – For hyperpigmentation, devitalized or environmentally damaged skin, contains a stabilized 30% vitamin C blend.
- Vital K (non-aqueous DO NOT USE WITH GALVANIC CURRENT) – For severely dry skin, rosacea, post treatment

Ampoules offer a concentration of highly active ingredients and have a much higher potency than day or night creams. Since skin can build resistance to this level of potency, its recommended ampoules are used one week per month.

Professional Tip: Put your signature touch onto your facial treatments. Apply an ampoule of choice to client's skin and infuse the concentrated ingredients with ultrasonic or galvanic current. This is an effective, low cost compliment to facial treatments and can also be used on the neck, décolleté, arms and hands. For optimal results, use after an enzyme or AHA peel.

After using an ampoule with Galvanic Treatment, the energy effects will still be working on the client's skin for an additional 2 days post treatment, making any product applied to skin work 10 times more efficiently.

Using Ampoules During A Treatment

- After a standard deep-cleansing facial, AHA peel or microdermabrasion treatment is performed. The skin is now in a prepared state to receive the active ingredients found in the specific ampoule.
- Select appropriate ampoule to be used, according to skin type (Note: Accurate skin type can often only be determined during/after extraction stage. Selection of ampoule should therefore not occur beforehand.)
- Massage the selected active ampoule throughout the entire facial area (1 ampoule/treatment).

Using Ampoules with Galvanic

Galvanic current skin care treatment is the process of using electrical currents to both cleanse the skin of impurities and infuse moisture into the deeper layers of the skin. The galvanic machine uses positive and negative ions to help maximize the absorption of skin care ingredients into the skin. Iontophoresis is used to introduce water-soluble substances into the skin. The effects the treatment has on the skin will depend on the product used and the charge of the active electrode.

Positively charged active electrode (anode)	Negatively charged active electrode (cathode)
<p>Acid reaction occurs producing the following effects:</p> <ol style="list-style-type: none"> 1. Skin tissue hardens and firms 2. Blood vessels vasoconstrict, reducing erythema 3. Soothes nerve endings 4. Astringent and germicidal action 5. Tightens pores <p>These effects are called anaphoresis.</p>	<p>Alkali reaction occurs producing the following effects:</p> <ol style="list-style-type: none"> 1. Skin tissue softens 2. Blood vessels vasodilate, increasing erythema 3. Stimulates nerve endings 4. Emulsification & removal of grease 5. Relaxes pores <p>These effects are called cataphoresis.</p>

Lontophoresis uses the principle that like charges repel and opposite charges attract, to aid the penetration of an ionized (+ or -) active product. Products used for this treatment have a variety of qualities and effects and come in various formulations such as ampoules, gels and creams. A product should be selected that is suitable for the client's skin. As Lontophoresis is a penetrating treatment, it is usually best carried out in the later stages of the facial so that the active ingredients can remain within the skin.

Ampoules or Serums (aqueous-based ONLY) that contain positively charged ions (cations) and a positive active electrode will repel this product into the skin. Remember positive active electrodes also produce the anaphoresis effects on the skin.

Ampoules or Serums (aqueous-based ONLY) that contain negatively charged ions (anions) and a negative active electrode will repel this product into the skin. Remember a negative active electrode also produces the cataphoresis effects on the skin.

CAUTION: It is very important that all metals, piercings or jewelries are NOT worn during a Galvanic Facial. Pregnant women and people who have metal implants, heart bypass, and seizures are not good candidates for Galvanic Current
