Please be aware that the QMI Sampling Assembly Bags are sterile and are intended for single-use. Each QMI Aspirate Sampler is also sterile and will accommodate collection bags during sample handling.

1. Place the bags into a container of ice or ice water. This will reduce or eliminate bacterial growth during the sampling process.

2. Using the QMI Flow Control Clamp, adjust the flow for the proper filling rate of the bag during sampling.

3. After you finish sampling, remove the needle from the sampler and place the needle into the needle disposal. I.e. do not dispose of the needle into the bag.

4. Mix the milk inside the bag and pour the proper amount into a shipping container.

R. Proper use of the QMI Sampling Assembly Bag:

Sample.
