Cereal Yellow Dwarf Virus-RPV
Catalog number: 28001

Technical Note

For maximum sensitivity, we recommend that you perform the sample incubation step of the CYDV-RPV test overnight at 4° C. *Cereal yellow dwarf virus* is typically present at very low concentrations in infected tissue.

Substrate color development in this test tends to be slow. Optical density values can be measured at up to 3 hours after addition of substrate, as long as the negative control well remains clear.

The CYDV-RPV test may have slight cross-reaction to the serologically related virus BYDV-RMV.
